CYCLE
(mobile vessel)

by

Philip Mazeikas

CONCEPT:

Instantaneous differential of stasis of congruent dimension and integral axis of dimensional velocity derives longitudinal field upon dissension of inert proximate frequency.

BLUEPRINT:

The determined variable upon a disjunction upon force remains constant and invariable unto the return of a fixed and static pressure.

SYNOPSIS:

The limit inverted by pressure of instantaneous release of frequency of determined value designates limit.

SCHEMATIC:

RECTIFIER
*"inert variance"*

ION
*"variant field"*
→
INFRARED
*"juncture"*
→
HYDROGEN
*"gravitational limit"*

DESIGN:

The rectifier dislimits pressure upon integral dimension. The beta wave inverts static threshold upon indeterminant field. The oscillator defines congruence upon displaced inert axis. The vacuum enters dissension. The ion defines indeterminant variance upon integral dimension. The infrared measures limit upon instantaneous derivative of inert variance. The hydrogen derives instantaneous differential upon displaced interval of pressure and static field.

POSTULATE:

Indeterminant pressure upon variant integral dimension of stasis enters variance.

ENGINEERING:

Postulate upon integral field denies incongruent axis of differential of inert pressure and dislimit.

THEORY:

Derivative upon instantaneous limit enters integral variance upon displaced axis.

ANALYSIS:

Instantaneous limit defines pressure upon inverse threshold of differential of field and threshold of integral pressure.

CONCLUSION:

Cycle defines inverse measure upon differential of stasis and congruent dimension.

PROSPECT:

Cycle enters field upon interval of stasis of inert gravitational axis.
