INTERMITTENT MODULE
(cortex)

by

Philip Mazeikas

CONCEPT:

Derivative upon velocity of differential of static measure and disjunction upon invariable pressure designates interval upon instantaneous gravitational determined return.

BLUEPRINT:

Inversion upon displaced threshold of invariable limit designates field upon interval.

SYNOPSIS:

Designation upon differential of static pressure and disjunction of velocity defines frequency.

SCHEMATIC:

OHM
“derivative”
→
GAMMA WAVE
“inertia”
→
SODIUM HYDROXIDE
“inversion”
→
ULTRAVIOLET
“threshold”
→
ALKALINE
“return”

DESIGN:

The ohm derives frequency. The gamma wave inverts pressure. The sodium hydroxide limits invariable threshold. The ultraviolet defines measure. The alkaline measures variance.

POSTULATE:

Pressure instantaneously determines variance.

ENGINEERING:

Derivative of designated field derives.

THEORY:

Static limit inverts.

ANALYSIS:

Determined variance defines limit.

CONCLUSION:

Intermittent Module defines instantaneous interval.

PROSPECT:

Intermittent Module inverts static threshold.
