

INX
(regain of discharge)

by

Philip Mazeikas

CONCEPT:

Interval upon deposited rectification upon invariable field of static derivative of pressure denies incongruent differential of inert variant limit and designated inertia.

BLUEPRINT:

In the variable distinction of every given constant impact upon the reaction of the velocity of distinction between non variable and reaction, the impact upon the magnitude of designated form regains every value.

SYNOPSIS:

The measure determined of improper threshold of designated force determines improper release.

SCHEMATIC:

HERTZ

"variant limit"

→

CARBON

"threshold"

→

NITROGEN

"inverse determinant"

→

ION

"measure"

→

CELL

"derivative"

DESIGN:

The hertz measures variant displaced function of definition of limit. The carbon inverts field upon designated acceleration. The nitrogen defines incongruent rationalization upon invariable dislocation of differential of static measure and instantaneous pressure. The ion defers measure. The cell determines interval upon congruent return.

POSTULATE:

Differential of inverse threshold of axis defines measure.

ENGINEERING:

Instantaneous velocity upon differential of derived frequency and determined axis defines congruence.

THEORY:

Pressure upon dislocated interval of static entropy enters recourse.

ANALYSIS:

Postulate upon integrity of inert static variance dislimits instantaneous quotient.

CONCLUSION:

Inx defines instantaneous gravitational limit upon deferred measure.

PROSPECT:

Inx dislimits incongruent dimension of definition of function of inertia.
