RUEX
(underwater breathing mechanism)

by

Philip Mazeikas

CONCEPT:

Differential upon vertex designated measure enters return.

BLUEPRINT:

Instantaneous constant of differential of determined vestige of proximate analogous derivative of inert
pressure and congruence of displaced matrice of variant limit enters dislocation.

SYNOPSIS:

Pressure upon instantaneous dimension of incongruent field measures variable.

SCHEMATIC:

ION
"variance"
→
PRISM
"congruent axis"
→
ULTRAVIOLET
"measure"
→
BETA WAVE
"threshold"

DESIGN:

The ion inverts stasis of determined inertia. The prism determines inert field upon instantaneous
velocity. The ultraviolet defines longitudinal designated entropy. The beta wave enters instantaneous
analogous derivative of pressure.

POSTULATE:

Variance of definition of inert axis of dislocated pressure defines limit.

ENGINEERING:

Postulate upon congruence of designated variable acceleration derives stasis of interval of
instantaneous threshold.

THEORY:

Pressure upon interval of variable field dislocates upon interval of gravitational axis.

ANALYSIS:

Congruence upon variant determined field of static longitudinal inertia enters postulate of variant field.

CONCLUSION:

Ruex defines stasis upon variant determinant interval of dislocated axis.

PROSPECT:

Ruex enters field of static force upon determined analogous inertia.
