

THE ANALOG  
(recording format)

by

Philip Mazeikas

CONCEPT:

Definition upon return of static derivative of instantaneous limit defines return.

BLUEPRINT:

The dispersion of static and interval of intermediary pressure resounds limited upon a frequency of inverted and unjuxtaposed result of determined velocity.

SYNOPSIS:

Limit inborn upon a sequence of differential and unjuxtaposed measure of instantaneous release determines value.

SCHEMATIC:

*"field"*

## DESIGN:

The magnet defines derivative upon sequential derivative of instantaneous pressure. The coil instantaneous limits differential of static limit and instantaneous frequency. The delta wave defines threshold upon variant dimension. The joule determines variable stasis upon invariable measure. The prism designates derivative upon instantaneous differential of static threshold of invariable limit and designated field. The carbon defines pressure upon instantaneous interval of derived threshold. The infrared inverts static limit.

## POSTULATE:

Definition upon variable pressure inverts upon static threshold of instantaneous limit.

## ENGINEERING:

Derivative upon static variance of instantaneous measure defines variable threshold of instantaneous interval.

## THEORY:

Definition upon variant limit defines instantaneous derivative of static measure.

## ANALYSIS:

Derivative of invariable pressure defines instantaneous derivative upon interval.

## CONCLUSION:

The Analog defines instantaneous measure upon invariable pressure.

## PROSPECT:

The Analog derives instantaneous limit upon derivative of static interval.
