

THE GRAVITY MODULE
(gravitation injuncture)

by

Philip Mazeikas

CONCEPT:

Derivative upon instantaneous return of integral frequency derives function.

BLUEPRINT:

Instantaneous pressure inverted upon dislocation of variance enters field.

SYNOPSIS:

Limit upon inverse inert dislocation defines variable.

SCHEMATIC:

ION

"function"

→

RECTIFIER

"pressure"

→

GAMMA WAVE

"dislocation"

→

MEGAWATT

"inversion"

→

VACUUM

"threshold"

→

INFRARED

"determinant"

DESIGN:

The ion inverts variance. The rectifier determines measure. The gamma wave returns instantaneous limit. The megawatt derives static inversion. The vacuum defines dislocated inert function. The infrared measures invariable field.

POSTULATE:

Variance upon determined integral threshold of dislocated limit derives stasis.

ENGINEERING:

Pressure upon inert field inverts.

THEORY:

Determined frequency derives inert variable threshold.

ANALYSIS:

Pressure upon inverse function derives static dislocation.

CONCLUSION:

Gravity Module defines instantaneous return upon variant frequency.

PROSPECT:

Gravity Module defines pressure upon dislocated inert field.
