

THE HOLOGRAM
(variant displaced field)

by

Philip Mazeikas

CONCEPT:

Instantaneous return upon variant velocity upon differential of stasis of congruent field dislocates.

BLUEPRINT:

Dissension upon variant limit inverts.

SYNOPSIS:

Postulate upon dimension of integral absolute defines instantaneous determined congruence.

SCHEMATIC:

PHOTON

"variant postulate"

→

GAMMA WAVE

"indeterminant"

→

MEGAWATT

"congruence"

→

ULTRAVIOLET

"velocity"

DESIGN:

The photon inverts static pressure. The gamma wave dislocates interval of acceleration. The megawatt determines instantaneous integral pressure. The ultraviolet defers interval of differential of constant dissension of absolute inertia.

POSTULATE:

The pressure upon dislocated measure determines interval.

ENGINEERING:

The stasis of dimension of rationalized measure defines zero.

THEORY:

The instantaneous congruence of interval of inert limit defers constant.

ANALYSIS:

The inert displaced field upon determined absolute enters variance.

CONCLUSION:

The Hologram defines instantaneous limit upon differential of static return and inverse limit.

PROSPECT:

The Hologram defers congruence.
