

THE ICE LAMP
(perpetual freezing lamp)

by

Philip Mazeikas

CONCEPT:

Dislocated frequency upon invariable sequential derivative of function of axis defines interval.

BLUEPRINT:

The return upon displaced force designates a velocity upon return.

SYNOPSIS:

The static measure of determined variable denies limit.

SCHEMATIC:

ULTRAVIOLET

“axis”

→

VOLT

“determined limit”

→

MERCURY

“dislocation”

→

ION

“variant quotient”

DESIGN:

The ultraviolet determines vestige upon determinant field. The volt denies axis upon integral proximate force. The mercury enters instantaneous pressure. The ion displaces inert congruence upon determined frequency.

POSTULATE:

Inert postulate upon dissension of integral value enters dislimit.

ENGINEERING:

Proximate disequence upon variance of static prelocation of variable field defines determinant.

THEORY:

Analogous threshold upon inverse determined quotient of stasis enters prelocation.

ANALYSIS:

Postulate upon variant dislocation of denial of inert function defers congruence.

CONCLUSION:

The Ice Lamp defines measure upon integral proximate entropy.

PROSPECT:

The Ice Lamp deters frequency.
