

TRACTOR BEAM
(derivative pressure)

by

Philip Mazeikas

CONCEPT:

Return upon variant dissension of threshold of analogous derivative of static influx derives measure.

BLUEPRINT:

Directive upon sequential interval of postulate of insequence defers variance.

SYNOPSIS:

Instantaneous threshold upon dissension enters return.

SCHEMATIC:

DIODE

"disjunction"

→

VACUUM

"indeterminant"

→

ALPHA WAVE

"dissension"

→

PRISM

"interval"

→

ION

"return"

DESIGN:

The diode inverts static pressure. The vacuum returns variant integral dissension. The alpha wave derives inversion. The prism dislocates field. The ion determines congruence.

POSTULATE:

Inverse field upon dissension returns.

ENGINEERING:

Determinant field dislocates upon integral dimension.

THEORY:

Pressure upon dimensional axis determines designated variance.

ANALYSIS:

Disjunction upon pressure determines inverse congruent field.

CONCLUSION:

The Tractor Beam determines inversion upon stasis upon integral juncture.

PROSPECT:

The Tractor Beam designates postulate upon inverse axis of field.
