

MAXCHIP
(microchip)

by

Philip Mazeikas

CONCEPT:

Differential upon variant integral release of static coordinate function of inert pressure defines constant interval upon determined variance upon dislocated field.

BLUEPRINT:

Coordinate pressure upon interval of static measure of integral value enters prelocated variance upon determined magnitude of frequency.

SYNOPSIS:

Inert value deposited upon incongruent limit enters coordinate.

SCHEMATIC:

HERTZ

"designation"

→

CARBON

"threshold"

→

SILVER

"function"

→

DIODE

"limit"

→

GAMMA WAVE

"order"

DESIGN:

The hertz enters composite limit upon designated field. The carbon derives instantaneous pressure. The silver defers composite return upon dislocated measure. The diode enters prelocated integral release. The gamma wave defers measure.

POSTULATE:

Internal variance upon prelocated variance of interposed return of static interval enters field.

ENGINEERING:

Postulate upon return of absolute coordinate enters prelocated variant limit upon designated function.

THEORY:

Pressure upon analogous measure enters prelocated interval.

ANALYSIS:

Interval upon instantaneous quotient of absolute metric of field enters dissolution.

CONCLUSION:

Maxchip derives coordinate field.

PROSPECT:

Maxchip enters prelocated variance upon integral force.
