

THE LIGHT TRANSLATOR

(photonic transfiguration)

By

Philip Mazeikas

CONCEPT:

Variable mass upon metric of axial destitution of pronoun upon inclosure of regress of variable electronic measure of inverse diametric variance enters variable.

BLUEPRINT:

Allocated degree of retention upon atomic mass, in variable quotient of limit upon absolute fission of photonic measure of interval of return, measure variable entropy.

SYNOPSIS:

Property of magnetic mass upon intonation of variance defines limit.

SCHEMATIC:

PHOTON

(quotient)

->

AMPLITUDE

(magnetism)

->

BETA WAVE

(prominence)

->

ION

(constant)

DESIGN:

The photon measure mass. The amplitude denies wave form. The beta wave inverts diametric equity of atomic vestige of property of incongruence. The ion displaces measure.

POSTULATE:

Incongruence upon immeasure of denotation of clause, upon impending denotation of metric of atomic order, defines threshold.

ENGINEERING:

Pressure, in amplitude of coordinate flux of measure, denies mass.

THEORY:

Coordinate frame of absolute variance, defers pretense.

ANALYSIS:

Composite variance in coordinate pretense of variable mass, inverts.

CONCLUSION:

The Light Translator invalidates pretense upon magnetic ratio of pressure.

PROSPECT:

The Light Translator refrains concordance upon postulate of variable quotient of entropy.
